

Smooth_Moretraining | Online plots reconstructed offline | 363 real eye-controlled choices

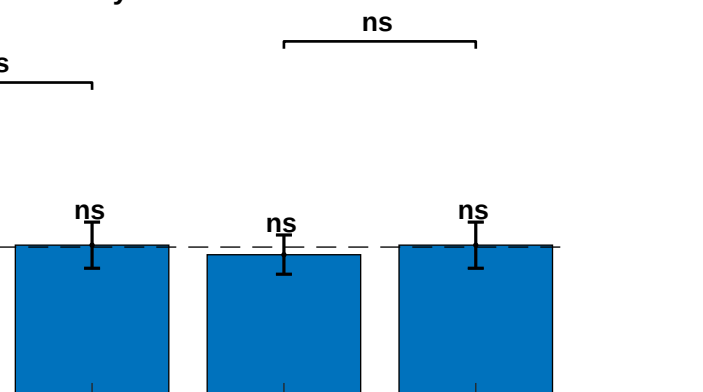

Signed reward difference

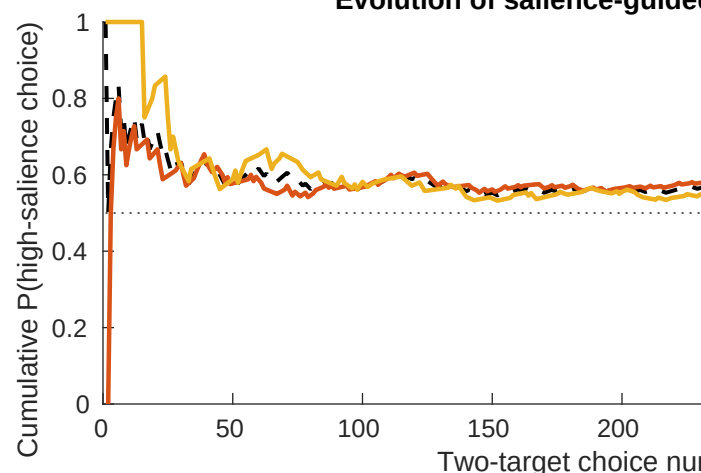

Signed hue-saliency evidence

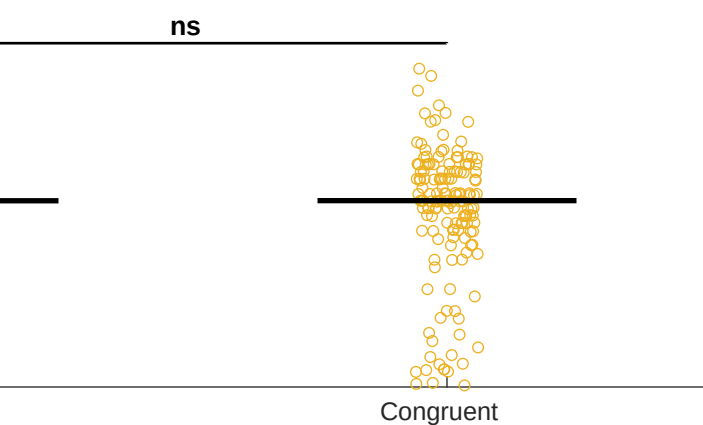

Choice by task condition

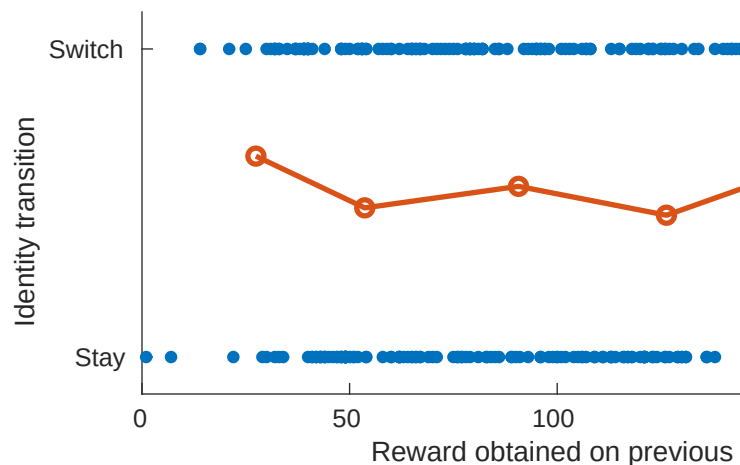

Evolution of saliency-guided choice

Choice by task condition
High reward: conflict
High reward: congruent
median difference p=0.877

Previous reward vs switch: r=0.054

ore reward. B: signed visual-saliency evidence; positive values mean T1 was more salient. C: choice proportions with 95% Wilson confidence intervals. Stars above
ct test. D: cumulative probability of choosing the high-saliency target, shown overall and by condition. E: individual saccadic reaction times and medians; the bracket
identity stay/switch as a function of previous reward; the title reports the permutation correlation. Stars use FDR-adjusted q-values where a family correction is avail
